

Lampiran 4. Perhitungan Kebutuhan Pyraclostrobin.

$$\text{Jarak tanam polybag} = 30 \text{ cm} \times 20 \text{ cm} = 600 \text{ cm}^2 = 0,06 \text{ m}^2$$

$$\text{Populasi tanaman/ha} = \frac{10000}{0,06} = 166666 \text{ tanaman/ha}$$

$$\text{Dosis pyraclostrobin} = \frac{400 \text{ ml/ha}}{166666} = 0,0025 \text{ ml/tanaman}$$

$$\text{Konsentrasi larutan} = 1:1000$$

$$= 0,0025 \text{ ml pyraclostrobin} : 0,0025 \text{ L air/tanaman}$$
